

## System Backups

### Do you hate losing money? Would you fight to keep your business afloat?

If you're nodding, think back to the last time you checked your backup system for successful operation. Was it working then? Would you notice if it *wasn't* working?

Many businesses underestimate the devastation that occurs when their server fails (or is stolen) and there is no backup available due to faulty tapes, a faulty tape drive or incorrect configuration. If your business cannot afford to be without its:

- accounting and payroll systems
- company templates and documents
- email and contacts
- customer correspondence
- sales information and budgets
- other mission-critical information

... **tsh** can help!

We can review and test your current backup system and suggest ways to improve its operation to ensure you get the most reliable backups possible. We ensure that the most important information is located on the server (as opposed to individual workstations) and include it in the backup job. Also, we will advise you of best practices regarding rotation, storage and replacement of tapes, drive cleaning and report checking.

Remember that backups can stop working at any time without you knowing! This is why **tsh** recommends that backups are checked at least every six months by a support professional.

Don't gamble with your business! Call today to arrange for one of our consultants to make sure your backup will not let you down!
